

Product Engineering Intern (AI-Native)

Company: MyStorage — Vietnam's first professional self-storage company **Location:** Ho Chi Minh City (on-site, with flexibility) **Type:** Internship, 6 months · Full-time (Mon–Fri) **Team:** Technology (reports to Tech Lead, under the Chief Commercial Officer) **Compensation:** Paid internship + full-time conversion path

Why this role exists

Most internships give you a sandbox project that gets deleted when you leave. This one doesn't.

MyStorage runs a real business — self-storage, valet storage, hyperlocal lockers, and wine storage — serving thousands of customers across Vietnam, Korea, and Japan. Our tech team is small and the backlog is not. We built STOW, our AI sales agent that lives inside Zalo OA group chats, and won the **Technology & Innovation Award (Asia)** and **Creative & Marketing Award (Vietnam)** from the Self Storage Association Asia.

We're looking for one intern who can take a problem, build the thing, and ship it to production — with **Claude Code** as their primary engineering tool. Your work will be used by real customers and real colleagues within weeks of joining.

Six months full-time is long enough to do this properly: roughly a month to get your bearings and ship your first small things, then five months owning real work end to end.

What you'll actually do

- **Ship features to production.** Customer-facing pages on mystorage.vn (Next.js / Headless WordPress), internal dashboards, and booking flows. Real PRs, real code review, real deploys.
 - **Build internal tools that remove manual work.** Our Sales, Marketing, and Operations teams still do things by hand that shouldn't be done by hand. You'll find them and automate them — n8n workflows, Airtable automations, Zoho CRM integrations, Google Chat bots.
 - **Work on STOW.** Prompt design, evaluation, tool integrations, and the plumbing that connects an AI agent to a live sales pipeline.
 - **Wire up data.** Google Tag Manager server-side tagging, BigQuery pipelines, and turning messy operational data into something a human can make a decision from.
 - **Prototype fast.** When someone on the team says "I wish we had X," you should be able to have a working version in front of them the same week.
-

How we work (and what "AI-native" means here)

Claude Code is our default way of building. That does **not** mean prompting until something compiles. It means:

- You write a clear spec before you write code — because a vague spec produces vague software, whether a human or a model writes it.

- You read every line the model produces and you can defend it in review. If you can't explain it, it doesn't ship.
- You know when to reach for AI and when to just write the code yourself. Both are correct answers in different situations.
- You test. Generated code that looks right and is wrong is worse than no code at all.

We care far more about how much real product you can ship than about how many years of experience you have.

What we're looking for

Required

- **Available full-time for 6 consecutive months.** If you're a final-year student, this means your coursework and thesis are done or light enough that you can be here five days a week — we'd rather you tell us now than three weeks in
- Final-year student, recent graduate, or self-taught builder — degree not required
- Comfortable with JavaScript/TypeScript **or** Python, and Git
- You've built and shipped something outside of coursework. A side project, a bot, an automation, a tool for a friend's business — anything with real users, even five of them
- Genuine hands-on experience with AI coding tools (Claude Code, Cursor, Copilot) and honest opinions about where they help and where they don't
- Working English (our docs and codebase are in English; the team speaks Vietnamese day-to-day)
- You ask questions early instead of quietly getting stuck for three days

Nice to have

- Next.js, React, or WordPress
 - SQL, BigQuery, or any data warehouse
 - Experience with LLM APIs, RAG, agents, or MCP
 - Automation platforms (n8n, Zapier, Make)
 - An eye for design — you notice when something looks wrong
-

What you get

- **Ownership of shipped features**, with your name on them, that you can point to in every future interview
 - **Direct mentorship** from our Tech Lead and Software Engineer, plus exposure to how Commercial, Marketing, and Operations actually make decisions
 - **A full Claude Code license** and the tooling budget to work properly
 - **A serious conversion path.** We hire from this internship. If you ship, we'll make you an offer
 - **Small-company leverage.** You'll sit close enough to the business to see the effect of what you build on revenue
-

How to apply

Send to **[careers email]** with the subject line **Product Engineering Intern — [Your Name]**:

1. Your CV (PDF)
2. Links to anything you've built — GitHub, a live URL, a demo video. This matters more than the CV
3. A short note (under 300 words) answering: **what's the last thing you built with an AI coding tool, and what did you have to fix yourself?**

Optional but it will move you to the front of the queue: spend two hours with Claude Code building something small and useful for a self-storage business — a pricing calculator, a unit-availability checker, an ops dashboard, whatever you think we'd want. Send us the repo and tell us what you'd do next with another two hours.

We review on a rolling basis and reply to everyone.

MyStorage is an equal opportunity employer. We hire on ability and curiosity.
